A; Description: cleaves activation peptide from trypsinogen to produce active trypsin A; Pathway: intestinal digestive hydrolase cascade
C; Superfamily: enteropeptidase; Clr/Cls repeat homology; LDL receptor ligand-binding
C; Keywords: glycoprotein; hydrolase; serine proteinase; transmembrane protein; zymog
F;1-784/Product: enteropeptidase heavy chain #status predicted <HCH>
F;22-38/Domain: LDL receptor ligand-binding repeat homology <LDL1>
F;342-504/Domain: LDL receptor ligand-binding repeat homology <LDL1>
F;342-504/Domain: LDL receptor ligand-binding repeat homology <LDL1>
F;643-677/Domain: Clr/Cls repeat homology <Clr>
F;643-677/Domain: Scavenger receptor cysteine-rich domain homology #status atypical
F;785-1019/Product: enteropeptidase light chain #status predicted <LCH>
F;785-1014/Domain: trypsin homology <TRY>
F;116,147,179,318,335,388,440,470,503,534,630,682,706,725,848,887,909,949/Binding si
F;772-886,810-826,910-977,441-956,967-995/Disulfide bonds: #status predicted
F;825,876,971/Active site: His, Asp, Ser #status predicted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           A;Molecule type: mRNA

Plasma kallikrein (EC 3.4.21.34) precursor - rat

N.Alternate names: Fletcher factor; kininogenin; serum kallikrein

C;Species: Rattus norvegicus (Norway rat)

C;Actes (C) - Sep. 1992 #sequence revision 30.5ep-1992 #text_change 09-Jul-2004

C;Acces (C) - Sep. 1992 #sequence ration (S) - Sep. 1991

R;Beaubien, G.; Rosinski-Chupin, I.; Mattei, M.G.; Mbikay, M.; Chretien, M.

Biochemistry 30, 1628-1635, 1991

A;Title: Gene structure and chromosomal localization of plasma kallikrein.

A:Poference number: A39180; MUID:91129236; PMID:1993180

A;Description: dissolves the fibrin of blood clots; acts as a proteolytic factor in a value of the graafian follicle; also activates the urokinase-type plasminogen act A;Pathway; fibrinolysis
C;Superfamily: plasmin; kringle homology; plasminogen-related protein precursor homology C;Keywords: fibrinolysis; glycoprotein; hydrolase; kidney; kringle; plasmin; protein precursor homology fileroduct: plasminogen #status predicted <PRO>
F;1-77/Domain: plasminogen-related protein precursor homology (fragment) <PLPH>
F;1-77/Domain: plasmin chain A #status predicted <APT>
F;1-77/Domain: activation peptide #status predicted <APT>
F;1-77/Domain: kringle homology <KR1>
F;4-1-62/Domain: kringle homology <KR2>
F;3-58-435/Domain: kringle homology <KR2>

C;Comment: The protein, synthesized in the liver, circulates as a noncovalent complex w:
C;Comment: The zymogen is activated by factor XIIa, which cleaves the molecule into a liq
are linked by one or more disulfide bonds.
C;Comment: The enzyme cleaves Lys-Arg and Arg-Ser bonds. It activates, in a reciprocal ratiogen and may also play a role in the renin-angiotensin system by converting prorenin in C;Genetics:
A;Gene: GDB:KLK3

A;Description: catalyzes the proteolytic activation of coagulation factor X in the preser A;Pathway: blood coagulation intrinsic pathway
C;Superfamily: coagulation factor X; EGF homology; Gla domain homology; trypsin homology
C;Keywords: beta-hydroxysapartic acid; blood coagulation; calcium binding; carboxyglutami
F;1-146/Product: coagulation factor IXa light chain #status experimental <ALC>
F;1-45/Domain: Gla domain homology (fragment) <GLA>
F;51-82/Domain: EGF homology <EGI>>
F;147-181/Domain: EGF homology <EGI>>
F;147-181/Domain: activation peptide #status experimental <APT>
F;182-416/Product: coagulation factor IXa heavy chain #status experimental <AHC>
F;182-4409/Domain: EGF homology <EGI>>
F;182-4409/Domain: activation peptide #status experimental <AHC>
F;182-4409/Domain: trypsin homology <TRY>
F;18-23,51-62,56-71,73-82,88-99,95-109,111-124,132-290,207-223,337-351,362-390/Disulfide
F;53/Binding site: carbohydrate (Ser) (covalent) #status experimental
F;64/Modified site: erythro-beta-hydroxyaspartic acid (Asp) #status experimental
F;158,168,173,261/Binding site: carbohydrate (Asn) (covalent) #status experimental
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          A;Note: structure and location of a carbohydrate covalently bound to Ser C;Comment: Factor IX is activated by factor XIa, which excises the activation peptide IC;Comment: The gamma-carboxyglutamic acid residues arise by posttranslational, vitamin C;Comment: Calcium binds to the gamma-carboxyglutamic acid (Gla) residues and, with sti

                                                                                                                                                                                                                                                                                                      C;Comment: Plasminogen is synthesized by the kidney and is present in plasma and many oth C;Comment: Plasminogen is converted into plasmin by plasminogen activators, both plasmin mediately after dissociation from the clot. In the presence of the inhibitor, the activation involves also removal of the activation peptide.

c;Comment: Stromelysin 1 (see PIR:KCMSS1) acts on plasminogen to produce angiostatin. Togetil treating solid tumors.
